Notifications

Receive notices of patient or member test results, emergency department visits, and/or hospital admissions or discharges.

CORHIO™
COLORADO REGIONAL HEALTH
INFORMATION ORGANIZATION

To keep pace with accountable care, quality improvement and risk-based payer programs, you need to know when a patient or member has new lab results, has visited an emergency department or been admitted or discharged from a hospital.

Through real-time or daily notifications, we can notify you when there is new information on your patients or members. Simply provide us with a current patient list or a targeted subset of patients and we return to you the most current data available from our network of participating labs, hospitals and health systems.

Methods of Delivery

CORHIO Notifications of lab results are available via:

- Daily batched reports (such as Excel or .csv)
- Real-time electronic interface (HL7 or Web Services/APIs)
- Real-time delivery into care management system

To comply with HIPAA and patient privacy, a participating customer must provide CORHIO with a current patient list at least every 30 days to account for new patients or deletions.

Use CORHIO Notifications to:

- Inform reporting for value-based contracts or quality reporting programs
- Improve your clinical intelligence toolkit with reports from Colorado's largest patient data repository of its kind
- Track high-risk patient encounters and test results outside of your network so you know exactly what happened
- Improve care management interventions and patient follow-ups, especially for high-risk patient groups or specific disease management programs

How CORHIO Notifications Work

You send patient or member file to CORHIO's secure FTP site → We match patients using our Master Patient Index (MPI) → We look for matching data (ex: ED admit or LOINC lab values) & send Notifications via your chosen delivery method

Notifications

Receive notices of patient or member test results, emergency department visits, and/or hospital admissions or discharges.

Acute Care Events—ADTs

Notifications of emergency room and/or hospital admissions include information available from the admission/discharge messages which include (but are not limited to): patient demographics, admission type, sending facility, admission date/time, discharge diagnosis, payer information, provider information, and allergies.

Lab Test Results

CORHIO delivers discrete laboratory and observation results on your targeted patient population based on your patient file. Lab values for the following conditions or diseases are now available:

- Diabetes—results including Hemoglobin A1C
- Cholesterol—results from lipid panels, including Total Cholesterol, High-Density Lipoprotein Cholesterol (HDL-C), Low-Density Lipoprotein Cholesterol (LDL-C), and Triglycerides
- Hepatitis—results from hepatitis panel, including A, B and C and antibody results
- COVID-19—results from molecular (RT-PCR) test

Additional notification types are being planned, so speak to your Outreach Manager or email to info@corhio.org if you have requests.

Out-of-State Notifications

Additionally, CORHIO Notifications customers who have a patient admitted to a hospital or emergency department out of state will receive a notice of that event (if it occurs in one of the locations we are connected to via the Patient Centered Data Home project). Learn more at https://www.corhio.org/about/nationwide-data-exchange.

"It's crucial for us to know what's going on with our patients. Sometimes it can be hard to find out if a patient went to the hospital, even after the fact. Notifications from CORHIO give us an early heads up on the hospitalizations so we can more quickly follow up with the patient and see how we can help them."
