

# EHR Results Delivery

*Integrate results into your workflow*

Having access to patient results at the point of care – without having to log in to a separate computer system – can save crucial time and allow for faster and more accurate clinical decision-making. CORHIO offers a more advanced form of health information exchange involving a secure, electronic connection between your electronic health record (EHR) system and the CORHIO network. An EHR connection enables your patients' hospitalization and test results to seamlessly route into the EHR you use every day, so workflow changes and training requirements are minimal.

Results available through the CORHIO network:

- Laboratory and pathology results
- Imaging and radiology reports
- Transcription notes
- Admission, discharge, transfer information

## **EHR Compatibility**

CORHIO has successfully interfaced with many of the EHR vendors regularly used by physician practices and health clinics, including Amazing Charts, GE Centricity, NextGen, Athena, and Allscripts.

## **Custom Development**

In unique situations where the traditional Results Delivery product is not appropriate or useful, CORHIO can work with organizations to develop custom solutions to meet your needs.

### Use EHR Results Delivery to:

- Improve workflow by having access to patient results from outside your network at the point of care
- Cut back or eliminate faxes from hospitals and time spent chasing down patient medical records
- Customize the information you receive in your EHR by choosing which hospitals and labs to receive results from, and in some cases, how the results appear in your system

“The CORHIO interface is awesome! We receive records every day from various hospitals directly into our patient charts and they’re reviewed by my providers that same day. This saves hours of time. Before CORHIO, we would have to either fax over requests for medical records, wait to receive them via fax, or log on to the hospital medical record system and print them out. Then the records had to be scanned into the chart. This has all been eliminated.”

*Stephanie Elliott, Practice Manager, Complete Family Medicine*
